

Introduction of JCI Guidelines: Guidelines for Assessment of Existing Concrete Structures, 2014

既存構造物の性能評価指針2014

Scope

- (1) These Guidelines cover general requirements methods and procedures for assessment of existing concrete structures (buildings and civil engineering structures). In view of the necessity and importance of the use of existing standards/specifications for assessment these Guidelines also set forth the method of using these standards/specifications.
- (2) These Guidelines are applicable not only to reinforced concrete structures but also to prestressed concrete structures and reinforced concrete portions of steel-framed reinforced concrete structures.
- (3) These Guidelines also cover existing concrete structures that have undergone rehabilitation/retrofitting.
- (4) Assessment of the remaining performance of

concrete structures damaged by fire is out of the scope of these Guidelines.

- (5) These Guidelines shall be applied under the judgment and responsibility of the responsible engineer taking account of the characteristics and importance of the target structure and the Japan Concrete Institute is not responsible for any of the consequences of the application of these Guidelines.

The guidelines has been posted on JCI website.

Contents

Chapter 1 General Rules

- 1.1 Scope
- 1.2 Terms and definitions
- 1.3 Framework of assessment
- 1.4 Flow of assessment
- 1.5 Assessment items

Chapter 2 Assessment Levels and Assessment Process Grades

- 2.1 Assessment levels
- 2.2 Assessment process grades
- 2.3 Investigation grades
- 2.4 Future prediction grade
- 2.5 Verification criterion grades
- 2.6 Possessed performance calculation grades

Chapter 3 Assessment Scenarios

- 3.1 General
- 3.2 Determination of objective and items of assessment
- 3.3 Formulation of master plan

Chapter 4 General Assessment

- 4.1 General
- 4.2 General investigation
- 4.3 Cause estimation of disorder
- 4.4 Establishment of verification criteria
- 4.5 Verification and judgment
- 4.6 Intervention based on general assessment
- 4.7 Preparation of general assessment report

Chapter 5 Detailed Assessment

- 5.1 General
- 5.2 Formulation of detailed assessment scenarios
- 5.3 Selection of standards/specifications applied to detailed assessment
- 5.4 Detailed investigation
- 5.5 Determination of characteristic assessment values
- 5.6 Cause determination of disorder

- 5.7 Future prediction of material properties
- 5.8 Performance verification
- 5.9 Assessment of margins
- 5.10 Judgment of necessity for intervention
- 5.11 Preparation of detailed assessment report

Appendix I Methods of Detailed investigation and Determination of Characteristic Assessment Values

Chapter 1 General

Chapter 2 Investigation into the Structure and Members

- 2.1 Cracking
- 2.2 Deflection/deformation/stiffness of members

Chapter 3 Investigation into Concrete

- 3.1 Strength and Young's modulus of in-situ concrete
- 3.2 Delamination/spalling of cover concrete and anchorage of embedded metal fittings
- 3.3 Carbonation depth
- 3.4 Chloride ions
- 3.5 Frost damage
- 3.6 Chemical-attack
- 3.7 Alkali-silica reaction
- 3.8 Moisture content into Concrete

Chapter 4 investigation into Reinforcement and Structural Details

- 4.1 Cover depth and bar diameter
- 4.2 Condition of reinforcement
- 4.3 Structural details related to bond/anchorage properties

Chapter 5 Determination of Characteristic Assessment Values

Chapter 6 Investigation into Actions

- 6.1 General principles
- 6.2 Direct actions
- 6.3 Indirect actions
- 6.4 Environmental actions

Appendix II Future Prediction of Material Properties

Chapter 1 General

Chapter 2 Future Prediction of the Material Properties of Concrete

- 2.1 Prediction of the progress of carbonation
- 2.2 Prediction of chloride ion ingress
- 2.3 Prediction of changes in the properties of concrete due to freezing and thawing action
- 2.4 Prediction of changes in the properties of concrete due to progress of chemical attack
- 2.5 Prediction of changes in the properties of concrete due to the progress of alkali-silica reaction
- 2.6 Progress of concrete deformation due to temperature changes/drying shrink-age/creep and prediction of changes in its properties
- 2.7 Future prediction of fatigue

Chapter 3 Future Prediction of Material Properties and Bond/Anchorage Properties of Reinforcement

- 3.1 Future prediction of the progress of corrosion
- 3.2 Future prediction of fatigue
- 3.3 Future prediction of bond/anchorage properties
